

New Probe Editing Handles

- KVP handles on probes in the 3D window appear stuck to the faces of the inner box.
- Probe KVP handles control the size of the inner box by default.
- Holding Ctrl+Shift while dragging KVP handles will adjust the outer box.
- Holding Ctrl+Shift while dragging move handles will move the probe center without moving the box.
- Dragging outside the probe in the 2D window will adjust the size of the inner box.
- Holding Ctrl+Shift while dragging outside the probe in the 2D window will adjust the outer box.
- Holding Ctrl+Shift while dragging *inside* the probe in the 2D window will move the center of the probe without moving the box, similar to the functionality in the 3D window.
- If Show Unselected Probe Boxes is enabled, the Alt+Click to resize probes and volumes will snap to other probes. We recommend turning on this option with a key-press as you need it, then turning it off again.
